

## MEETING 07/03/22

Javier was asked to use the simulation code with “Sacred” to log the necessary information out of the simulations. The output at each simulation must be a vector with the complexity indicators, the number of conflicts, the number of compound conflicts and the size of the biggest one. This must be done at every timestep if there is no conflict and, while at least one exists, the simulation must log only the maximum values reached by each variable along the time window between the beginning and end of the conflicts.
